The Dead Zone Matrix

Where does your decision sit? Score it on the four dimensions of the Algorithmic Readiness Index, the ARI.

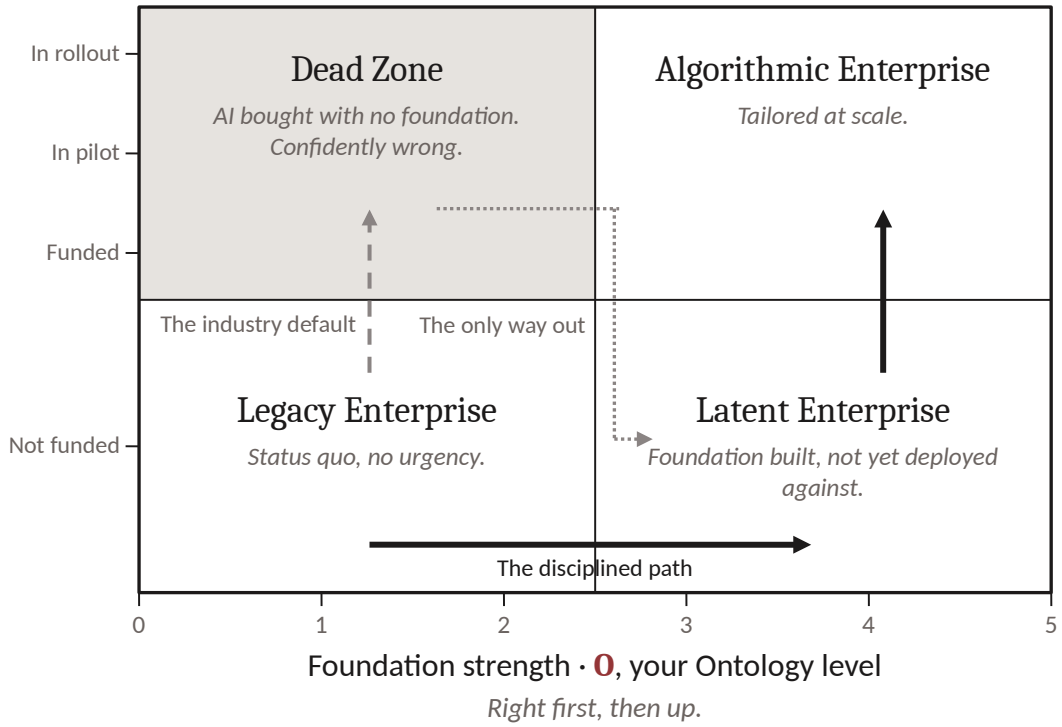

AI investment · through the **Deployment Audit**

The decision

Scored by | Date | Version

Where you stand

Ontology places you on the matrix. The ARI tells you whether the quadrant is earned.

Mark where your decision sits today, and where the next step moves it.

The weakest dimension sets the ceiling.

Score the four dimensions

O	**Ontology** Do the systems that feed a decision agree on what things mean?	0 0.0	1 0.2	2 0.4	3 0.6	4 0.8	5 1.0
J	**Judgment** Does the same case get the same answer?	0 0.0	1 0.2	2 0.4	3 0.6	4 0.8	5 1.0
D	**Decision** How long from fact to decision, against what the decision can tolerate?	0 0.0	1 0.2	2 0.4	3 0.6	4 0.8	5 1.0
S	**Scale** Shaped to the customer's situation, or the same template for everyone?	0 0.0	1 0.2	2 0.4	3 0.6	4 0.8	5 1.0

0 absent · 1 ad hoc · 2 structured · 3 systematic · 4 optimized · 5 self-correcting

Breaks first

_____ (Level __ · __)

The lowest dimension, and what it looks like today. If two tie, name both.

ARI = O × J × D × S, in decimals = ____

Where the ARI lands

Dead Zone	Transition	Compounding
below 0.10	0.10 to 0.30	over 0.30

Three questions that put the doubt back

PEOPLE · Stakeholder Interview
Who loses most, and have you asked them yourself?

ASSUMPTIONS · Reasoning Record
What evidence would prove you wrong?

PERMISSION · **Deployment Audit**
If this causes a loss, who answers for it by name,
and is that person senior enough for it to hurt?

Use the ARI to find where decision architecture breaks. Pay nobody against it. Move the thresholds once you know where your own breaks fall.
